

THE DREAM TOUR GEOSCIENCES MISSION

MODULE VII EARTH MATERIALS

Introduction

The traditional model of students passively learning facts and reciting them back out of context is no longer sufficient to prepare them to survive in today's world. In order to be successful in today's world and in the future they must possess the fundamental skills of reading, writing, computing, in addition to digital-age skills such as conducting research, working in teams, gathering, synthesizing, and reporting information, and using high tech tools in order to solve complex problems. Fundamental and digital-age skills are necessary for students to become active participants in the learning process, which is facilitated by a skilled teacher.

The Dream Tour, one of two outreach projects of The Harris Foundation (www.theharrisfoundation.org), is a motivational program that encourages America's middle school students (grades 6-8) to both find and achieve their potential by encouraging them to go to college and study science, technology, engineering, and mathematics (STEM) as a way to fulfill their dreams. Dr. Bernard Harris, the founder and CEO of the Foundation, travels to cities throughout the United States to encourage students to achieve their potential.

Missions and Modules

The Dream Tour Instructional Component consists of three missions – Aeronautics, Mechanics, and Geosciences. Each mission currently has three modules designed to expose middle school youth to STEM concepts, processes and content.

The modules do not form a middle school curriculum. The modules are not teaching plans. The modules are instructional resources that contain activities, suggestions, and projects related to six STEM concepts taught in grades 6-8 that can be incorporated into any curriculum or teaching plan. It will be necessary for the teacher to provide engaging content, experiments, investigations, and assessments that will result, when combined with module suggestions, in greater student commitment to learning and achievement. The missions and the modules are linked; therefore they may be taught in any order. The order in which the missions are taught is a teacher decision. Although the modules can be used in grades 6, 7, and 8, the target grade level is 8.

In each module, students will be involved in exploring STEM– related concepts simultaneously developing cross-curriculum skills while working in small collaborative teams. Each module will contain Student Learning Outcomes selected to challenge students and peak their interest in STEM. Students will be required to think critically and analytically, and to find and use appropriate learning resources. Each module is focused on experiential learning that foster active learning, support knowledge construction, concept development that integrate school learning and real life. Students will demonstrate their understanding of the Student Learning Outcomes by completing one or more of the Evidence of Learning suggestions.

The missions are described below.

The Aeronautics Mission

Aeronautics is the study of the science of flight. To design an airplane or other flying machine, aeronautical engineers must understand four basic areas - aerodynamics, propulsion, materials and structures, and stability and control. The three Aeronautics Modules are:

- The Science of Flight
- Space Travel
- STEM Careers in Aeronautics

The Mechanics Mission

Mechanics is the study of the way matter and forces interact with each other in the macroscopic world (bodies that you can easily see, in the solid state). Fields within mechanics are statics, dynamics, and kinematics. The three Mechanics Modules are:

- Physical Forces
- Machines and Inventions
- STEM Careers in Mechanics

The Geosciences Mission

The geosciences address all issues relating to Earth Systems, including the earth, oceans, and atmosphere. The major applications of the geosciences include exploration and development of natural resources (oil, gas, coal, minerals, water, soil), preservation of the natural environment, restoration from environmental damage, and exploratory research. The three Geosciences Modules are:

- Earth Materials
- Weather and Climate
- STEM Careers in Geosciences

All of the modules, except the Career modules, will contain the following components. The Career modules will not include the underlined components.

- Introduction – This component begins with a statement about middle school science. Followed by a definition for the six concepts with the primary concept for the module underlined.
- Student Learning Outcomes – Statements of what students should be able to do upon completion of the module are listed in this component.
- Evidence of Learning – This component contains ways that students can demonstrate their understanding of the Student Learning Outcomes.
- Module Preparation – This component contains advance planning, other information and the academic vocabulary for the module. The academic vocabulary will contain a core list of words that will appear in all of the modules except the career modules. Several other vocabulary words will also be included.
- Suggestions – This component contains Suggestions for Teachers and Suggested Student Activities. Teachers may add to or change the suggestions as long as students are provided opportunities to be actively involved in activities that will assist them in answering the Student Learning Outcomes.

- For Further Study – This component includes other activities that students can do. The activities could be used as homework assignments, make-up work, extra credit points, special assignments, or used in place of or in addition to the Suggested Student Activities. A suggested research topics and suggested research questions are also included.
- Resources – This component will contain one or more websites that can be used to develop teaching plans and/or with the suggested activities.
- Note to the Teacher – Though not a separate component, a Note to the Teacher may appear in module components.

Modules and the National Science Education Standards

According to the National Science Education Standards (NSES), “students should develop an understanding of what science is, what science is not, what science can and cannot do, and how science contributes to culture.” (National Research Council, 1996, p. 21)

The NSES presents broad unifying concepts and processes that provide linkages within and among different fields of biological, physical and earth sciences. Unifying concepts help students to construct a holistic understanding of and organize their thinking about science. The NSES also include content standards. Selected unifying concepts and content standards for 5-8 are reflected in the modules.

Below is a brief description of several unifying concepts identified in the NSES. The concepts in **boldface type and underlined** are the concepts that will be developed in the modules.

- **Systems, order and organization** To understand and interpret the world students need the ability to think about the whole in terms of its parts and about parts as they relate to one another and to the whole. “A system is an organized group or related objects or components that form a whole.” (NRC 1996) The amount of **matter, energy**, information and the rate at which they are transferred through systems varies. Science shows that there is order and predictability in nature in which certain events or conditions seem to be repeated at regular intervals or periods. Understanding the basic laws and theories that explain the world can be accomplished by connecting order and organization to **systems**.
- **Evidence, models and explanation** Students must have varied and numerous science experiences in a learning environment, which encourage the search for evidence. Models including physical objects, mathematical representations, and computer simulation are used to represent real objects and events, which may or may not be directly observable.
- **Constancy, change, and measurement** The concepts of constancy and change underlie most understandings of the natural and technological world. Through observations, students learn that some characteristics of living things, materials, and systems remain constant (constancy) over time, whereas others change. Through formal and informal studies, students develop an understanding of the processes and conditions in which constancy, change, and measurement take place.
- **Evolution and equilibrium** Evolution is a series of changes in systems. Systems may be biological, physical, or technological. Geological systems include chemical, physical and biological processes. As systems react to **forces** and change, a physical state called equilibrium may develop where forces and changes occur in opposite and offsetting directions.

The science process skills such as observing, classifying and predicting are integrated into NSES Content Standard A, Science as Inquiry. According to the Standards “Inquiry is a step beyond ‘science as a process,’ in which students learn skills... The new vision includes the ‘processes of science’ and requires that students combine processes and scientific knowledge as they use scientific reasoning and critical thinking to develop their understanding of science.” (National Research Council, 1996, p. 105)

It is important to remember that the Standards do not imply that inquiry should be used for every lesson. The Standards emphasize that a variety of teaching strategies (approaches) are necessary to serve the goal of learning science. It is also important to remember what scientific inquiry is, “a multifaceted activity that involves making observations; posing questions; examining books and other sources of information to see what is already known; planning investigations; reviewing what is already known in light of experimental evidence; using tools to gather, analyze, and interpret data; proposing answers, explanations, and predictions; and communicating the results.” (National Research Council, 1996, P. 23) Therefore inquiry should be taught throughout the school year.

Duration of a Module

The amount of instructional time devoted to each module will depend upon several factors including how the information will be used, class schedule, length of class periods, required curriculum, student interest, and depth of student preparation and prior knowledge.

How to use the Modules

First look at the primary concept in **boldface type and underlined** for each of the modules. Begin with the concept or topic most appropriate for your teaching plans. You do not have to teach all of the modules or begin with Module I and end with Module IX. The modules were developed so teachers could pick and choose the topics and/or activities needed for his/her teaching needs. The modules are equally adaptable to your required curriculum.

Then, review the Student Learning Outcomes for the module you have selected to find out what the students should be able to do upon the completion of the module.

Next, select the Evidence of Learning that you want your students to complete, then write the objectives and decide what knowledge (content) must be taught.

Finally, look at the Suggested Student Activities and select the activity or activities that you want you students to complete. Be sure to select the activities that will help students to complete the Evidence of Learning you have selected.

What, how, and when students’ knowledge is assessed is a teacher decision.

MISSION: GEOSCIENCES

MODULE VII TOPIC: EARTH MATERIALS

INTRODUCTION

Middle school science is frequently taught as separate disciplines – life science, earth science, and physical science. When concepts such as matter, energy, change, force and system are taught, the science disciplines come together. However, frequently students are taught these and other concepts individually increasing the chance that students will fail to understand how these concepts are connected. This module will focus on these concepts, which are essential to the teaching of life, earth, and physical sciences with emphasis on change and system.

Energy-Matter – Are interchangeable manifestations of substance and that which enables something to be moved or changed.

Change – Everything is in the process of becoming different or something else. The rate at which change happens varies from very fast to very slow so that it may not be noticed in extreme cases.

Force – Any influence that produces motion or that prevents motion; it is a push or pull upon an object.

System – A system is a whole that is composed of parts arranged in an orderly manner according to some scheme or plan. A change in one part tends to affect other parts in the system.

Matter can undergo physical and chemical changes. Chemical changes are linked to energy changes. Changes in phases (states) are examples of physical changes. If a substance changes into a new and different substance(s) it is a chemical change. Both types of changes occur with Earth's materials. Elements are the basic materials of matter. Matter is just different combinations of elements.

The History and Nature of Science (NSES, Content Standard G) should be an integral part of your teaching plans to reinforce the students' content knowledge.

STUDENT LEARNING OUTCOMES

Contrast natural and human effects on the environment and its resources.

Assess the use of technology in studying Earth's resources.

Evaluate the effects on the environment caused by air, water, and land pollution.

Explain the pros and cons of different energy resources.

EVIDENCE OF LEARNING

Summarize the Earth's resources and the uses for each resource.

Select an earth materials topic to conduct a case study.

Construct a graphic representation of the forms of energy and their transformations.

Collect and/or take digital pictures of energy transformations that occur to earth resources.

Make a semantic map for rock types.

MISSION: GEOSCIENCES

MODULE VII TOPIC: EARTH MATERIALS

MODULE PREPARATION

Before you begin this module, complete the following. If you are a “Dream Tour” school, the following activities should be completed before the main event to ensure that the students will be ready to be active participants.

Check for their understanding of the academic vocabulary words below in **boldface type**. A strategy such as “Think Pair Share” or “Pair Read” could be used.

Introduce the “new” academic vocabulary words. The first three steps to effective vocabulary instruction (Marzano) could be used. The nonlinguistic representation of the terms (graphic organizers or pictures) that the students produced can be displayed during the main event.

Another strategy could be used to introduce the new academic vocabulary words.

If you have not already done so, introduce your students to journal writing. Discuss the purpose and importance of journals and explain that journals are a means of recording ideas, opinions, and dreams. Therefore, there are no right and wrong answers. Journals are different from science notebooks. Science notebook entries could include vocabulary words, questions for discussion, class notes, and assignments.

Decide on the directions, task cards, charts and/or criteria for the student activities you have selected.

Along with the content you have identified that must be taught, select appropriate experiments and investigations related to the Evidence of Learning projects. Include experiments that will require students to form a hypothesis, identify variables and construct charts and data tables to record observations.

A Periodic Table of Elements will be needed for this module.

ACADEMIC VOCABULARY

Conservation
Force
Motion
Rocks
Weathering

Energy
Gravity
Nonrenewable resources
Speed

Erosion
Minerals
Renewable resources
Velocity

MISSION: GEOSCIENCES

MODULE VII TOPIC: EARTH MATERIALS

SUGGESTIONS FOR TEACHERS	SUGGESTED STUDENT ACTIVITIES
<p>Form collaborative teams of 3-5 students/team. Be sure to provide each team with a list of the Evidence of Learning. Unless labeled “Individual” the Suggested Student Activities should be done in student teams.</p> <p>Unless labeled “Individual” the suggested student activities are to be done by student teams.</p> <p>Ask what, how and why questions or conduct an activity that will require students to retrieve information about the focus of this module received in prior grades and or gained from prior life experiences.</p> <p>Earth materials can be classified into three basic types: lithosphere, hydrosphere, and atmosphere. Discuss what materials can be found in each type.</p> <p>Have the class plan a conservation service-learning project for your school, a neighborhood or the city.</p> <p>Discuss the difference between forms and kinds (potential and kinetic) of energy. This could be done while demonstrating how a pendulum works. A pendulum could be used to demonstrate kinetic energy and potential energy.</p> <p>As students complete activities, have them to add words, with operational definitions, to the academic vocabulary list.</p> <p>This is a good time to include the rock cycle.</p> <p>During the study of rocks and minerals, introduce the periodic table. Focus on those elements that are found in rocks and minerals and the most abundant earth elements.</p>	<p>Record entries into your journal; record experimental and investigative results and notes in your science notebook. (Individual)</p> <p>Use all of the academic vocabulary words and in writing a summary of flight. (Individual)</p> <p>As a class, list materials that are used everyday (pencils, plastic wrap, aluminum cans), discuss the resources from which the items listed are made.</p> <p>Compare and contrast forms of energy.</p> <p>Investigate rocks and minerals and their properties.</p> <p>Track the formation of oil and natural gas.</p> <p>Research and report on the products made from oil.</p> <p>Answer the following question: What technologies are being used to produce energy from renewable and nonrenewable energy resources? What are natural resources? How are rocks classified?</p> <p>Debate the pros and cons of the use of paper bags versus plastic bags.</p> <p>Compare and contrast constructive and destructive forces.</p> <p>Identify a local natural resource problem. Investigate what is being done to solve the problem or devise a plan to solve the problem.</p> <p>Investigate changes caused in the environment by the use or misuse of natural resources.</p>

MISSION: GEOSCIENCES

MODULE VII TOPIC: EARTH MATERIALS

FOR FURTHER STUDY

Have students analyze the effect on the environment caused by obtaining and using natural resources.

Have students conduct an Internet Scavenger Hunt on alternative energy resources.

Have students to design an experiment to test a product made from oil or wood. (NSES Content Standard E)

Have students research the internal and external processes of the Earth system that cause natural hazards or the role that human activities have on natural hazard. (NSES Content Standard F)

Have students suggest a plausible solution to reduce or eliminate one natural hazard that is caused by human activity. (NSES Content Standard F)

Have students demonstrate their understanding of the concept change by stating examples of change in one of the physical sciences.

Have students research the efforts being made by companies, organizations, and individuals to protect the environment.

Suggested Research Topics

Offshore drilling for gas and oil

Dust clouds

Environmental Protection Agency (EPA)

Conservation and Restoration

Suggested Research Questions

What are hydrothermal deposits?

How does the formation of coal differ from the formation of oil?

RESOURCES

Visit the Teacher Lounge and the Student Zone on the Dream Tour website (www.daring2dream.org) for STEM information and other resources. Visit the HUNSTEM link while you are there.

The site below contains information about oil and natural gas.
